DNA Dataset Generator (Points: 5%)
- Generator takes at least the number of clusters and number of points per cluster as parameters (5%)
  NOTE: Simply producing random strands will be awarded 1% only

Sequential Versions (Points: 12%)
- K-Means for 2D data points (6%)
- K-Means for DNA strands (6%)

MPI versions (Points: 60%)
- K-Means using MPI for 2D data points (30%)
- K-Means using MPI for DNA strands (30%)

Details (these are same for DNA and 2D data points versions):
- The code compiles and runs (1%)
- Initialize MPI and get the size and rank (1%)
- The master loads data from a file and sends workers their shares (3%)
- The workers receive data from the master (3%)
- The workers and the master apply K-means to their portions of data (adopting a good mechanism to compute new centroids) (6%)
- The workers send their intermediate data (either the summations and the count, or the count and average) to the master (5%)
- The master receives intermediate data from workers (3%)
- The master aggregates data and calculates the new means (3%)
- The master loops over for a new round (3%)
- After done, cleanly abort the program using the right MPI functions (1%)
- Compute the runtime correctly (1%)

Write-up (Points: 20%)
- Three scalability studies (plots and analysis) (15%)
- Experience in applying MPI to the K-Means algorithm (trade-offs of sequential vs. parallel) (2%)
- Thoughts on the applicability of K-Means to MPI (2%)
- Paper structure, level of writing, and language (1%)
Code Style (Points 3%)

- Method Comments, Block comments, Readability, Dead code, Code Design (3%)
  
  NOTE: Well-document functions that re-compute 2D and DNA centroids
